cDNA was synthesized with Superscript I using Sfil
oligo-dT primer. After first strand synthesis, RNA was
degraded by NaCH treatment and cDNA was amplified by PCR
reaction. The PCR products were digested with Sfil and

directionally cloned into a custom medium-copy vector and
transformations made with four size classes to minimize
size bias. Details of each source of RNA and library

/note="Vector: pBRcDNASfiAB; The library was constructed from 10 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library size bias.
